DARE TO **DEVELOP**

Introduction to CSS

Reuben Simpson

Agenda

- CSS
- More HTML and CSS

Languages for A Web Page

CSS

- Cascading Style Sheet

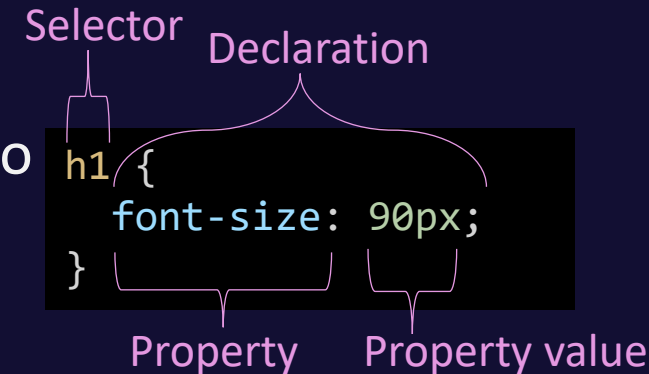

- Describes the style of web page – any element within and including <body>
- Saved in a .css file extension

- Selector is the html element(s) that the styling ruleset applies to

- Property is an aspect of style specified

- Property value is the value specified

- Declaration is a ruleset with **property:value** pair ending with semicolon

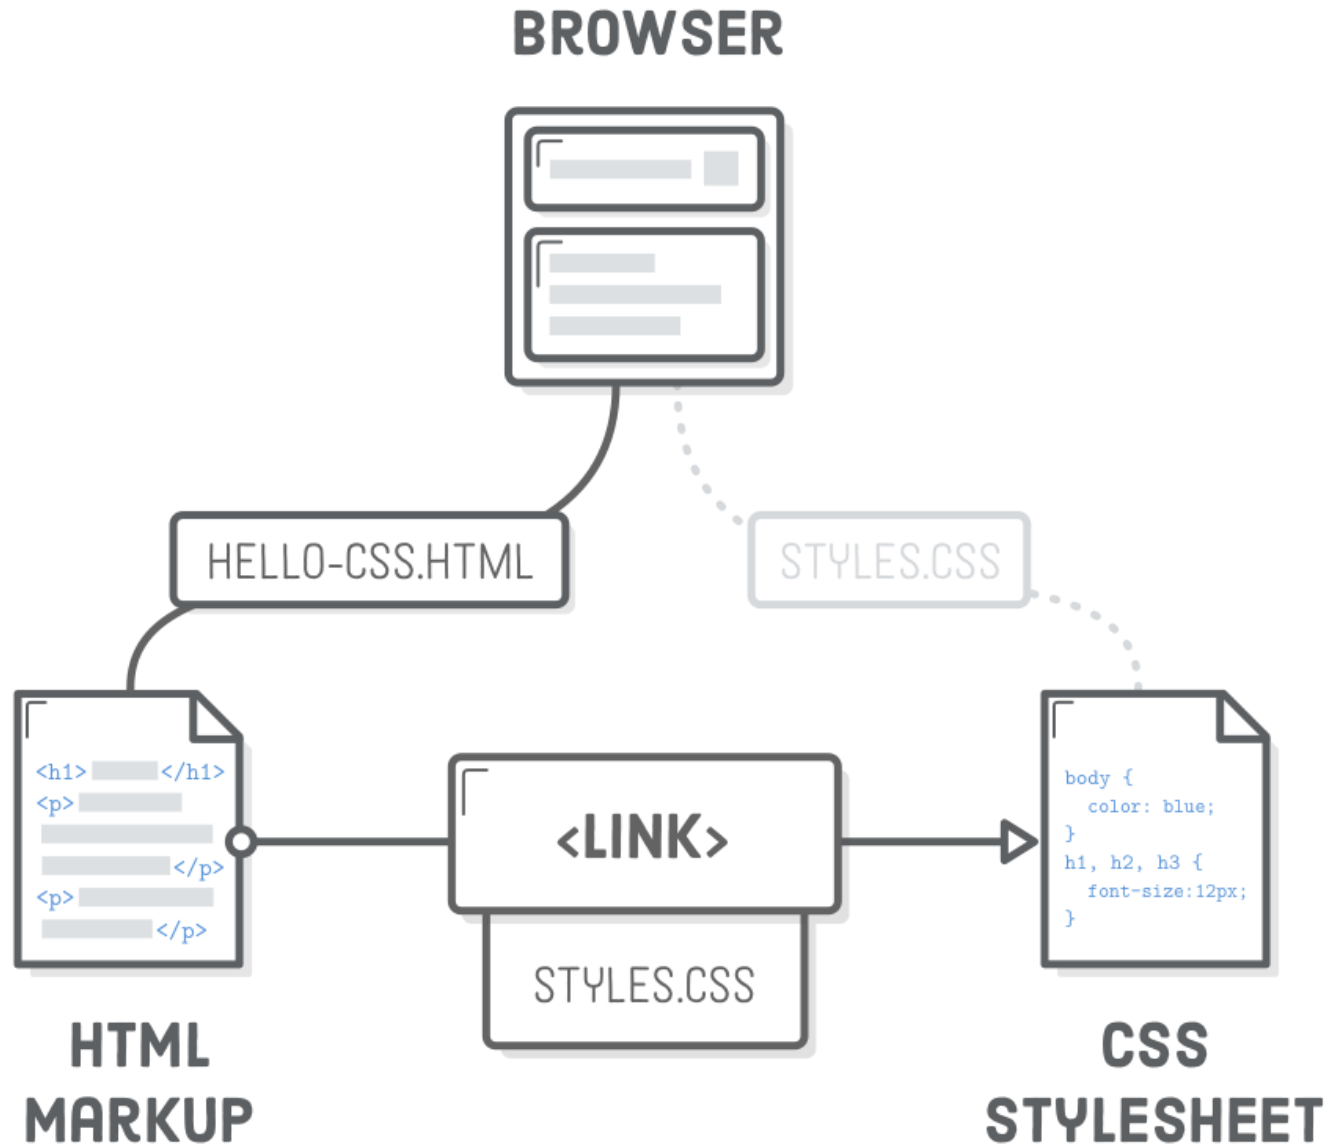

- Need to link up html and css by adding a <link> element in the <head> element of html file

```
<link href="main.css" rel="stylesheet" >
```

Path and name of css file

Your Turn

- Let's create a new HTML file and add the same code from yesterday

```
<!DOCTYPE html>
<html>
  <head>
    <title>Good Morning page</title>
  </head>
  <body>
    <h1>Morena!</h1>
    <p>This is my second web page</p>

    <h3>My favourite website:</h3>
    <a href="https://www.bing.co.nz">Google 😊</a>

    <h3>My favourite Foods</h3>
  </body>
</html>
```

Your Turn

- Create a new file in Visual Studio Code, save it as “style.css” in the same folder as your HTML file
- Put the following code into the file and save the file

```
h1 {  
  font-size: 90px;  
}  
  
p {  
  border: solid 2px purple;  
  color: purple;  
}
```

- You won't see any changes to your html yet because we haven't linked up the HTML and CSS files

Your Turn

- Switch back to your html file (it was opened as a tab on VS Code)
- Add the link element per below, notice it is in the <head> element, and there is no end tag

```
<!DOCTYPE html>
<html>
  <head>
    <title>Good Morning page</title>
    <link href="style.css" rel="stylesheet" />
  </head>
  <body>
    <h1>Morena!</h1>
    <p>This is my second web page</p>

    <h3>My favourite website:</h3>
    <a href="https://www.bing.co.nz">Google 😏</a>

    <h3>My favourite Foods</h3>
  </body>
</html>
```

- Save the file and preview the web page. You should see the font styles changed

CSS Rules

- CSS serves a completely different purpose. HTML represents the content of your web page, while CSS defines how that content is presented to the user.
- A CSS “rule” always start with a “selector” that defines which HTML elements it applies to.

CSS Comments

- You can use comments to explain a section of code
- CSS comments go between `/*` and `*/`

```
/* applies to all buttons */  
.button {  
  background-color: #d8e4ef;  
  margin: 2px 5px;  
  padding: 8px 15px;  
  text-align: center;  
}
```

CSS Selectors: Apply styles to one element by ID

- An ID is unique – it should only be applied to one HTML element

```
<!DOCTYPE html>
<html>
  <head>
    <title>Good Morning page</title>
    <link rel="stylesheet" href="style.css" />
  </head>

  <body>
    <h1>Morena!</h1>
    <p>This is my second web page</p>

    <h3 id="title">My favourite website:</h3>
    <a href="https://www.bing.co.nz">Google 😊</a>

    <h3>My favourite Foods</h3>
  </body>
</html>
```

```
h1 {
  font-size: 90px;
}
```

```
p {
  margin: 35px 0px;
  color: purple;
}
```

```
#title {
  font-family: "Tahoma";
}
```

CSS Selectors: Apply styles to multiple elements by class

```
<!DOCTYPE html>
<html>
  <head>
    <title>Good Morning page</title>
    <link rel="stylesheet" href="style.css" />
  </head>

  <body>
    <h1>Morena!</h1>
    <p>This is my second web page</p>

    <h3 id="title">My favourite website:</h3>
    <a href="https://www.bing.co.nz">Google 🤪</a>

    <h3>My favourite Foods</h3>
    <ul>
      <li class="dessert">Chocolate Fudge</li>
      <li class="dessert">Spaghetti Icecream</li>
      <li class="dinner">Broccoli</li>
      <li class="dinner">Pad Thai</li>
    </ul>
  </body>
</html>
```

```
/* CSS Element Selector */
h1 {
  font-size: 90px;
}
```

```
p {
  border: solid 2px purple;
  color: purple;
}
```

```
/* CSS ID Selector */
#title {
  font-family: "Tahoma";
}
```

```
/* CSS Class Selector */
.dinner {
  background-color: orange;
}

.dessert {
  background-color: blueviolet;
}
```

CSS Selectors: Apply styles to multiple elements by nesting

```
<!DOCTYPE html>
<html>
  <head>
    <title>Good Morning page</title>
    <link rel="stylesheet" href="style.css" />
  </head>

  <body>
    <h1>Morena!</h1>
    <p>This is my second web page</p>

    <h3 id="title">My favourite website:</h3>
    <a href="https://www.bing.co.nz">Google 😊</a>

    <h3>My favourite Foods</h3>
    <ul id="foods">
      <li class="dessert">Chocolate Fudge</li>
      <li class="dessert">Spaghetti Icecream</li>
      <li class="dinner">Broccoli</li>
      <li class="dinner">Pad Thai</li>
    </ul>
  </body>
</html>
```

```
/* CSS Element Selector */
h1 {
  font-size: 90px;
}

p {
  border: solid 2px purple;
  color: purple;
}

/* CSS ID Selector */
#title {
  font-family: "Tahoma";
}

#foods {
  font-family: "Comic Sans MS";
}

/* CSS Class Selector */
.dinner {
  background-color: orange;
}

.dessert {
  background-color: blueviolet;
}
```

Your Turn - Explore CSS

- Find out more about the following CSS properties from w3schools <https://www.w3schools.com/css/>.
- Practice using these elements on your web page
 - Color (If you want hex code for colours, use Google color picker)
 - Backgrounds
 - Text
 - Fonts
 - Selectors
 - CSS Comments
